D-ILA[®] HD Projection System (3-Chip D-ILA[®] Projector + Digital Video Processor)

Extreme HD. 1920 x 1080 Pixels Native Resolution.

For Those Unwilling to Compromise, Enjoy Quality Beyond Description with Extreme HD Resolution.

Three Native 1920 x 1080 D-ILA Chips

Thanks to the newly developed HD D-ILA devices, the native resolution of the DLA-HD2K is 1920 x 1080, the extreme HD resolution available today for home theatre projector applications. This makes the system suitable not only for highend home theatre use but also for critical viewing venues such as museums and post-production screening rooms.

D-ILA: The Most Advanced LCOS Technology Available

JVC pioneered the use of LCOS (Liquid Crystal on Silicon) technology and is the world's leading supplier of LCOS projectors. JVC's patented D-ILA chips are the most highly refined form of LCOS, offering unique performance characteristics not found elsewhere. The DLA-HD2K also boasts optimum colour illumination and a newly developed projection lens for its optical system that is explained below. This combination of advanced technologies allows the DLA-HD2K to realise a high contrast ratio of 2000:1 and breathtaking colour reproduction.

Optimum Colour Illumination is achieved from an economical ultra high-pressure NSH lamp that uses illumination optics to optimise the f-number for each primary colour. This exclusive JVC process ensures optimum contrast of individual colours and a D65 colour temperature that provides vivid, natural-looking colour reproduction.

Newly Developed Projection Lens employs a 4-group, 13-layer 100% glass lens with an aluminium tube and anti-flare finish. This high-quality construction embodies JVC's no-compromise approach to answering the performance potential of HDcompatibility. The optimised lens aperture is also carefully calibrated to match the zoom position.

Cost-effective NSH Lamp

To ensure lower running costs, the DLA-HD2K uses a 250W ultra high-pressure mercury NSH lamp, which should be replaced after approximately 2,000 hours of operation. And in most applications, the homeowner can easily change the lamp without removing the projector from its mounts.

JVC Exclusive 3-Chip D-ILA (Direct Drive Image Light Amplifier)

- Three D-ILA chips: JVC's exclusive 3-chip D-ILA technology produces rich, natural colours without the annoying flicker or "rainbow effect" that plagues singlepanel projectors. Images are as smooth as film, boasting incredible detail and vibrant, breathtakingly natural colours.
- Cinema-quality picture with no visible grid: There is no visible grid or "screen door effect" with JVC's D-ILA. Since the gaps between pixels are not noticeable, the picture is extremely smooth. You can enjoy the benefits of both filmlike resolution and accurate reproduction of natural colours.
- Superior Colour Reproduction: JVC's unique optical engine produces rich, natural colors with smooth gradations and low noise. By setting the colour temperature at the D65 standard, source media can be faithfully reproduced with the same gradations as the original picture. D65 colour temperature is equal to 6500 Kelvin, which is the home theatre standard for the optimal amount of light to recreate daylight. This makes all colour gradations natural and consistent, including absolute black and absolute white. Furthermore, JVC's exclusive AG* technology produces highly accurate gradations with low noise, particularly in darker areas of less than 20% brightness.
- True black reproduction: One important characteristic of D-ILA devices is that the crystals are aligned vertically, meaning that the D-ILA technology can reproduce blacks that are truly black. It also offers a uniform response, irrespective of brightness, so it can display a wide range of intermediate tones.

Exclusive Digital Video Processor

The DLA-HD2K is equipped with a digital video processor co-developed with Faroudja, a company renowned worldwide for creating powerful processing technologies. This exclusive JVC digital video processor can be connected to various sources including 480i, 480p and 576i SD signals as well as 720p and 1080i HD signals. Faroudja's colour matrixing provides accurate colour profiles for NTSC and HDTV, allowing the processor to convert standard analogue and digital DVI video signals to a high-resolution digital video signal that can be transmitted via the DVI-D connector to the projector and is fully HDCP compliant. This processor also allows for detailed video adjustment to suit viewer preferences and user setup between it and the projector can be profiled. Furthermore, the processor features motion adaptive de-interlacing with DCDi and 3-2 pull-down technology to ensure error-free progressive signals.

Convenient, Space-saving 2-piece Design

Unlike bulky one-piece units, the projector head of the DLA-HD2K is only 298mm W x 134mm H x 360mm D and weighs a mere 6.2kg. This smaller size allows for less conspicuous and more flexible installation as well as easier ceiling mounting. The projector head is connected to a standard rack-mountable electronics unit by a single zero-loss digital cable (DVI-D) transmitting the 1080/60P signal. The projector head and electronics unit can be separated by up to 5 meters — an ideal configuration that keeps the cabling to other electronic components to an absolute minimum while preserving full digital quality at the projector head.

Infrared Remote Controls

Remote controls employ discrete IR commands for common features and have discrete buttons for easy capture of IR data to 3rd party control systems.
